The most basic circuit component is the resistor. Although a resistor is an actual component consisting of a set resistance, any thing connected in a circuit has some value of resistance, although other types are generally referred to as impedance instead, but more on that later.

Example — the bridge circuit again We know that the series/parallel reduction method is not useful for this circuit! The star-delta transformation may solve this problem. The question is how to apply the transformation so that the circuit can become solvable using the series/parallel reduction or other ac

Simplifying the Figure 1A: a) Combine parallel branches R4 and R5: $10 \Omega / 2 = 5 \Omega$. b) Combine Step a in series with R3: $5 \Omega + 5 \Omega = 10 \Omega$.

An electronic circuit is a circular path of conductors by which electric current can flow. A closed circuit is like a circle because it starts and ends at the same point forming a complete loop.

Furthermore, a closed circuit allows electricity to flow from the (+) power to the (-) ground uninterrupted.
