The minimum total potential energy
principle is a fundamental concept used
in physics and engineering. It dictates
that at low temperatures a structure or
body shall deform or displace to a
position that (locally) minimizes the total
potential energy, with the lost potential
energy being converted into kinetic
energy (specifically heat).. Some

examples. A free proton and free electron will tend ...

In soil mechanics, the shear strength is evaluated using the Mohr-Coulomb (M-C) Failure Criterion. The M-C Criterion assumes that the shear strength depends on three factors: The normal effective stress (σ_n) The friction angle of the material (ϕ) The cohesion of the material (c) The qualitative correlation of those components is expressed as:
