The charge moves at a drift velocity  $v_d$  so the work done on the charge results in a loss of potential energy, but the average kinetic energy remains constant. The lost electrical potential energy appears as thermal energy in the material. On a microscopic scale, the energy transfer is due to collisions between the charge and the molecules of the material, which leads to an increase in ...

An interesting rule for total power versus individual power is that it is additive for any configuration of the circuit: series, parallel, series/parallel, or otherwise. Power is a measure of the rate of work, and since power dissipated must equal the total power applied by the source(s) (as per the Law of Conservation of Energy in physics), circuit configuration has no effect on the mathematics.

In a scientific context, power refers to the rate at which energy is transferred. Electrical power, then, is the rate at which electrical energy is transferred. The unit is watts (W), where one watt is equal to the transfer of one joule (J) of energy in one second (s).  $1\text{ W}=1\frac{\text{J}}{\text{s}}$  Electric power in watts is equal to voltage in volts ...
