New Flora of The British Isles. In the nine years since the appearance of the Third Edition, many new data and ideas relating to our wild flora have become available. More than 200 species and hybrids have been added to the text of this fourth edition and, in order to establish it as a truly twenty-first century Flora, alien species that have not been recorded in the British Isles since 1999 (about 90

taxa) are omitted from the main text.

In most of Great Britain there is a temperate climate which receives high levels of precipitation and medium levels of sunlight. Further northwards, the climate becomes colder and coniferous forests appear replacing the largely deciduous forests of the south. There are a few variations in the generally temperate British climate, with some areas of subarctic conditions in areas such as the Scottish Highlands and Teesdale, and even sub-tropical in the Isles of Scilly.

The British Isles lie at the juncture of several regions with past episodes of tectonic mountain building. These orogenic belts form a complex geology that records a huge and varied span of Earth's history. Of particular note was the Caledonian Orogeny during the Ordovician Period, c. 488-444 Ma and Early Silurian period, when the craton Baltica collided with the terrane Avalonia to form the ...
