High-speed multimedia radio is the implementation of high-speed wireless TCP/IP data networks over amateur radio frequency allocations using commercial off-the-shelf hardware such as 802.11 Wi-Fi access points. This is possible because the 802.11 unlicensed frequency bands partially overlap with amateur radio bands and ISM bands in many countries. Only licensed amateur radio operators

High-speed networking research moved up the protocol stack to be more concerned with multimedia applications. In the late 1990s, we had the practical application of fast packet switching technology to IP routers, which became IP switches. This was caused by the failure of Asynchronous Transfer Mode (ATM) and the decreasing cost in hardware.
