Lecture Notes on Hybrid Systems, c J. Lygeros, 2004 2 • Given two real numbers  $a \leq b$ ,  $[a,b] = \{x \in \mathbb{R} \mid a \leq x \leq b\}$  denotes the closed interval from  $a$  to  $b$ , while  $[a,b) = \{x \in \mathbb{R} \mid a \leq x < b\}$  denotes the right-open interval from  $a$  to  $b$ . Notice that if  $a = b$ , then  $[a,b] = [a,a] = \{a\}$ , whereas  $[a,b) = [a,a) = \emptyset$ .

systems in a nutshell in Chapter 2.4 before we deal with continuous-time systems in the following chapters. We introduce hybrid systems and as a modeling language hybrid automata in Chapter 3. In the following chapters we consider di erent subclasses of hybrid automata with increasing expressive power, and methods for their safety analysis.

ECE7850 Wei Zhang •Theorem 1 Assume (i)  $\dot{x} = f(x,u)$  has a control Lyapunov function  $V$ ; and (ii) the cor- responding  $\mu$  defined in (1) makes  $f(x,\mu(x))$  locally Lipschitz. Then  $\mu$  asymptotically stabilize the system. - can be easily extended to obtain stronger stability result. • e.g.:if  $\beta_1 x \alpha \leq V(x) \leq \beta_2 x$  and  $W$  can be chosen as  $cV(x)$  with  $c>0$ , then  $\mu$

Dynamical systems that are described by an interaction between continuous and discrete dynamics are usually called hybrid systems. Continuous dynamics may be represented by a continuous-time control system, such as a linear system  $\dot{x} = Ax + Bu$  with state  $x \in \mathbb{R}^n$  and control input  $u \in \mathbb{R}^m$ .

This course provides an introduction to hybrid control. We start by presenting a modeling framework for hybrid systems that combines elements from automat a theory and differential equations. The students are then guided through a set of techniques that can be used to analyze and design hybrid control systems. The course also includes an overview of simulation tools for hybrid systems with ...
