### Section What Is A Solution

In chemistry, a solution is a special type of homogeneous mixture composed of two or more substances. In such a mixture, a solute is a substance dissolved in another substance, known as a solvent. The mixing process of a solution happens at a scale where the effects of chemical polarity are involved, resulting in interactions that are specific to solvation.

### Solution - Wikipedia

Section 1: What is a Solution? Solution is known as a homogeneous mixture of two or more substances uniformly dispersed throughout a single phase. There are two main parts to any solution. The solute is the component of a solution that is dissolved in the solvent; ...

Solution section: discuss the solution. Since your problem is unique, the research will not present the solution to your problem. However, the research will discuss similar problems and the solutions to these problems. This research will provide you information with which to formulate a solution that is relative to your specific problem.

Process solution is used when no one is in the critical section, and someone wants in. In bound waiting solution, after a process makes a request for getting into its critical section, there is a limit for how many other processes can get into their critical section. Peterson's solution is widely used solution to critical section problems.

Solutions to the Critical Section Problem. Assumption. assume that a variable (memory location) can only have one value; never ``between values" if processes A and B write a value to the same memory location at the ``same time," either the value from A or the value from B will be written rather than some scrambling of bits ; Peterson's ...

This is a two process solution. Let us consider two cooperative processes P1 and P2. The entry section and exit section are shown below. Initially, the value of interested variables and turn variable is 0. Initially process P1 arrives and wants to enter into the critical section.

Peterson's algorithm (or Peterson's solution) is a concurrent programming algorithm for mutual exclusion that allows two or more processes to share a single-use resource without conflict, using only shared memory for communication. It was formulated by Gary L. Peterson in 1981. While Peterson's original formulation worked with only two processes, the algorithm can be generalized for more than two.

Your group can try the one that members prefer; all should yield some good solutions. Simply go around the room and ask everyone to suggest ideas.

### Section 6. Generating and Choosing Solutions

The part of the process, where the code for accessing the shared resources is written, that part or section is the critical section (CS) of that process. Now the critical section problem is to implement such a solution, which can be used by the processes to cooperate when they share common resources.
